L4: Entry 1 of 1

File: USPT

Jul 21, 1998

DOCUMENT-IDENTIFIER: US 5784162 A

TITLE: Spectral bio-imaging methods for biological research, medical diagnostics and therapy

Detailed Description Text (156):

Corals also harbor a variety of invertebrates; some are sessile and attached to the coral skeleton, other burrow within it or are overgrown by the coral tissue and skeleton. The coral inhabiting crab *Cryptochirus coralliodytes* is found in pits in massive coral skeletons and is common in faviidae corals in Eilat, Israel. Potts [Potts (1915) Papers from the department of Marine Biology: 33-69] described the morphology of these crabs and the structure of their pits. However, the nature of the relationship between the crab and its host is unclear. It is suggested that the coral epibionts may contribute their excreta to the adjacent algae including zooxanthellae.
